

Bamboo Oxygen Park

Bamboo Oxygen Park is a green haven designed to enhance your surroundings and contribute to a healthier environment. Bamboo, a fast-growing and versatile plant, emits a large amount of oxygen into the atmosphere while absorbing carbon dioxide. Every Bamboo tree at its full growth generates over 300 kg of oxygen and a mature bamboo after four years absorbs more than 400 kg of CO₂ annually from its surroundings. As you explore this park, you are not just enjoying a recreational space but actively participating in an ecological initiative to improve air quality. Beyond oxygen production, bamboo provides additional ecological benefits such as soil conservation, water retention, and habitat for a variety of wildlife.
